Eric Raptosh Photography/ Getty Images Call these songs bedroom music, or quiet storm, or mood sets. if you really want to be polite about it. But basically, they're sex songs: songs about getting a little something. Unlike other romantic songs, these tunes from R&B do not talk about love, it is a good old-fashioned lust. Let's check out this mix of songs that convey this excitement, including music by R. Kelly, Usher, Aaliyah, Trey Songz and The Isley Brothers. David Corio/Redferns/Getty Images Such a powerful melody, it inspired a new name for sex songs: bump and grind music. Here's a sample of the opening lyrics of the track: Sit on the couch, Take off my shoes / Let me rub your body before the rip / The honey-loving man is ready to flex / Girl flex, time to have sex / Let's start here and work our way around / I won't stop until I hear the sound 'oooh, aah'. Obviously, there is a controversial side to R. Kelly, but there is no denying that he knows how to skip an erotic encounter. Dimitrios Kambouris/Getty Images for Michael Kors In an interview with People magazine, Miguel said he was inspired to write this song on sex charges after being on a long journey and was eager to get home with Adorn to his girlfriend. Key lyrics: These lips, I can't wait to taste your skin baby, and those eyes, I can't wait to see your grin, Just let my love, just let my love adorn you. Jamie McCarthy/Getty Images for Gabrielle's Angel Foundation Like another song on this list, Trey Songz's Dive, Usher's melody uses a water metaphor to convey a message about sex. A sample of the lyrics: It's raining inside your bed, No parts are droopy, Love makes you so wet, your legs, thighs/ And since we met you knew me, I knew I was ready baby, to take that dive. David Becker/WireImage/Getty Images Ginuwine collaborated with Timbaland on this 1999 song that is guaranteed to set the mood for erotic pleasure. He is waiting all night for his lover to return his calls because he is so anxious. RJ Capak/Getty Images Rock The Boat is the most erotic song recorded by Aaliyah. She is in charge and giving instructions: Work the middle. Change position, new positions... I need you to use yourself/ like you never did before. To explore my body. Until you reach the coast. Larry Busacca/Getty Images for MTV In the Dive In, Trey Songz uses suggestive metaphors to equate love by making me bathe: I'm about to dive, babe holds my breath, we're about to get it swimming in your body, let me dive, you know I'm not about to dive into this pool, goin' underneath Maury Images for BET Ladies were in ecstasy when heartbeat Tyrese, Ginuwine and Tank teamed up to form TGT, and the three studs fantasized the woman about how Sex never felt better. They're lying: Bring him here, turn off his phone, leave them heels, take off his clothes, I don't want to see anyone else, because I'm yours. Your. Larry Busacca/BMA2015/Getty Images for DCP John Legend and his wife Chrissy Teigen are known for their public displays of affection, which he sings about PDA (We Just Don't Care). In this song, Legend lets out his inner freak: I see you downstairs from the restaurant, let's sneak in and do it when your head is gone, everyone's leavin', we'll have fun, oh maybe it's wrong, but you're turning on me. Cary Hammond/Redferns/Getty Images The Isley brothers delivered the perfect seduction stage to Let's Lay Together from the 1996 Wayans Brothers comedy Don't Be a Menace... Ronald Isley demonstrates how convincing a reluctant partner is the time to release his inhibitions. Your body is warm, but you're still not sure, I'll let you know I have the perfect care, yes, step into my room and I'll take your fears, put your trust in me and everything I say, tell me, can we stay?. Ethan Miller/BET/Getty Images for Bet Jeremih began his career in 2009 by hitting number one with his autobiographical melody, Birthday Sex. She says her goal was to write a song that caters to women in her day. He managed to create an anthem that expressed the perfect birthday present. Jordi. Jeff Kravitz / FilmMagic for MTV A Love After War, Robin Thicke tires about the inevitable makeup process that comes after a couple has a big fight: Oh, it's a knockout baby, you won the fight, I told you I'm sorry I acted like a selfish kid / Please forgive me baby... You know I can do well, tired. Ironically, Thicke released the song three years before their infamous 2014 breakup and eventual divorce from his wife, Paula Patton. Jordi. Michael Tran / FilmMagic Ever had sex that was so good, you have to stay for more, even though you know it's late for work. Then you can definitely relate to what Ne-Yo calls, Lazy Love. Jordi. Erika Goldring/Getty Images Most of the songs on this list were recorded by men, however, the ladies also want to call the shots in the bedroom. In Give It To Me Right, Melanie Fiona lays out the law for between the sheets: When I get it, I'd better be satisfied, so give it to me well, or don't give it to me at all. J. Holidays. Frazer Harrison/Getty Images for AMA J. Holiday created an international frenzy from Paris, France to Paris, Texas with its 2007 seduction hit simply titled, Bed. It gave new meaning to the phrase, which is hidden. Erika Goldring/Getty Images Goapele is known for her social, political and mind-minded music, however, she showed off her sensual side in her 2011 play song which appeared on a Victoria's Secret Dream Angels. She tires, I want to play, play, tell me if you think you can get off / Because that's what I'm dying for, I mean that's what I'm dying to do. Jordi. Jeff Fusco / Images This is a Sex Jam S&M direct, with Anthony David seducing the listener with lyrics like I've been watching, waiting, hoping, wishing we can get it on let me present you with some sweet pain. I had an interesting day at the IDC Directions Conference in Boston this week in which Don Tapscott, author of Wikinomics, delivered the inaugural address. The common theme of the conference was disruptive innovation (which I still like to call disruptive technology, as disruptive innovation feels a little too euphemistic for me, like when automotive CEOs call mass layoffs a restructuring). In his speech, he highlighted the social and economic revolution that has occurred during the Web 2.0 movement,

and most importantly what effects it will have on ER as we enter an era when companies collaborate both within and outside their borders to foster better innovations. (I've discussed these issues with Tapscott when stopped by a Q&A recently to discuss Wikinomics). But one thing he talked about in his speech made me do a face-to-face (even as the steadfast believer on Web 2.0 that I espoused myself to be). He noted how, over the next few years, we will gradually move to the world where almost all the work can be done through a web browser, where we will have all the tools we need at our fingertips without the need for, for example, a Windows operating system. Sitting in the audience, I imagined what life would be like to get into Target, plop down \$400 for a cheap laptop with Linux and a web browser and stand in my way. It made me think: Has the collaborative movement, where we constantly make incremental improvements to existing technologies, has made us level in terms of how to investigate and develop new inventions? Recently, I've been doing some research on it R&D. The Economist had a great report highlighting how large research labs that came to typify technological innovation (such as a PARC, for example) have all been marginalized or closed together, with companies deciding to focus on software and services, and existing technologies rather than hardware. Probably the paragraph that stuck the most: On the surface, American innovation has never been stronger. American companies spend about \$200 billion on R&D annually, much of it on computing and communications. Microsoft, for example, spent about \$6.6 billion last year; IBM and Intel about \$6 billion each; and Cisco Systems and Hewlett-Packard (HP) about \$4 billion each. Most of this money went into making small incremental improvements and getting new ideas to market quickly. So I thought: What does the rise of Web 2.0 mean and increased collaboration for research and development? As I write this, I look at my computer and wonder, is this how a computer will always look like? Engineers only playing with iPods or a BlackBerrys until we get them right? Will all the functions we want to perform be done through Firefox? Is that it? Then I took my acid reflux medications and realized that this is not the case. What we see happening is that research and development of technologies is being decentralized as a result of the as facilitated by open source development and web-based applications. Best of all, it's creating real wealth in companies that aren't just internet companies. What does this change in R&D mean for you? It angers you that you're gone the days when we threw a lot of smart people into a lab and hoped for the best? Or is it great? For now, I would discuss the latter. But I'd love to hear your thoughts.
